

CLAIMS

What is claimed is:

1. An apparatus for supporting a computer monitor, the apparatus comprising:
 - a computer monitor base, including:
 - a bottom portion for placement on a surface;
 - a link coupled to the bottom portion; and
 - a monitor support member coupled to the link,
 - wherein a tilt angle of the monitor support member is dependent on an adjustable height of the link.
2. The apparatus of claim 1, wherein the monitor support member is configured to be attached to a computer monitor.
3. The apparatus of claim 2, wherein the computer monitor is a liquid crystal display.
4. The apparatus of claim 2, wherein the tilt angle determines a tilt of the computer monitor.

5. The apparatus of claim 2, wherein the height of the link determines a height of the computer monitor.
6. The apparatus of claim 2, further comprising:
a plurality of springs coupled to the link and configured to counter-balance a weight of the computer monitor that is attached to the monitor support member.
7. The apparatus of claim 1, wherein the tilt angle increases in response to a decrease in the height.
8. The apparatus of claim 1, wherein the tilt angle decreases in response to an increase in the height.
9. The apparatus of claim 1, wherein the link comprises a first pair of top and bottom links, and a second pair of top and bottom links.
10. The apparatus of claim 9, further comprising:
a plurality of springs coupled to the link and configured to provide spring resistance to the link when the link moves to another position.

11. The apparatus of claim 10, wherein the plurality of springs comprises:

a first spring configured to provide spring resistance to the top link in the first pair of links;

a second spring configured to provide spring resistance to the bottom link in the first pair of links;

a third spring configured to provide spring resistance to the top link in the second pair of links; and

a fourth spring configured to provide spring resistance to the bottom link in the second pair of links.

12. The apparatus of claim 1, further comprising:

at least once cover for covering at least a portion of the link.

13. A method of assembling an apparatus for supporting a computer monitor, the method comprising:

assembling a bar link that includes a spring mechanism and screw elements 165;

attaching a computer monitor support member to the bar link; and

attaching the bar link to a base bottom portion.

14. An apparatus produced in accordance with the method of claim 13.

15. The method of claim 13 wherein the monitor support member is configured to be attached to a computer monitor.

16. The method of claim 15, wherein the computer monitor is a liquid crystal display.

17. The method of claim 13, wherein the monitor support member has a tilt angle that determines a tilt of a computer monitor.

18. The method of claim 13, wherein the bar link has a height that determines a height of a computer monitor.

19. The method of claim 13, wherein the spring mechanism comprises:

a plurality of springs coupled to the bar link and configured to counter-balance a weight of a computer monitor that is attached to the monitor support member.

20. The method of claim 13, wherein the monitor support member has a tilt angle that increases in response to a decrease in height of the bar link.
21. The method of claim 13, wherein the monitor support member has a tilt angle that decreases in response to an increase in height of the bar link.
22. The method of claim 13, wherein the bar link comprises a pair of top and bottom links, and a second pair of top and bottom links.
23. The method of claim 13, further comprising:
attaching at least once cover for covering at least a portion of the link.
24. An apparatus for supporting a computer monitor, the apparatus comprising:
a computer monitor base, including:
means for placing the computer monitor base on a surface;
coupled to the means for placing, means for supporting a monitor and for providing a tilt angle to the monitor; and

coupled to the means for supporting, means for providing an adjustable height to a link, wherein the tilt angle is dependent on the adjustable height of the link.
